How much history is needed for personalization?

A

What determines whether personalization can be learned?

Population phase pattern + **Stable personal signature** + **Cycle-to-cycle variation** + **Day-level noise**

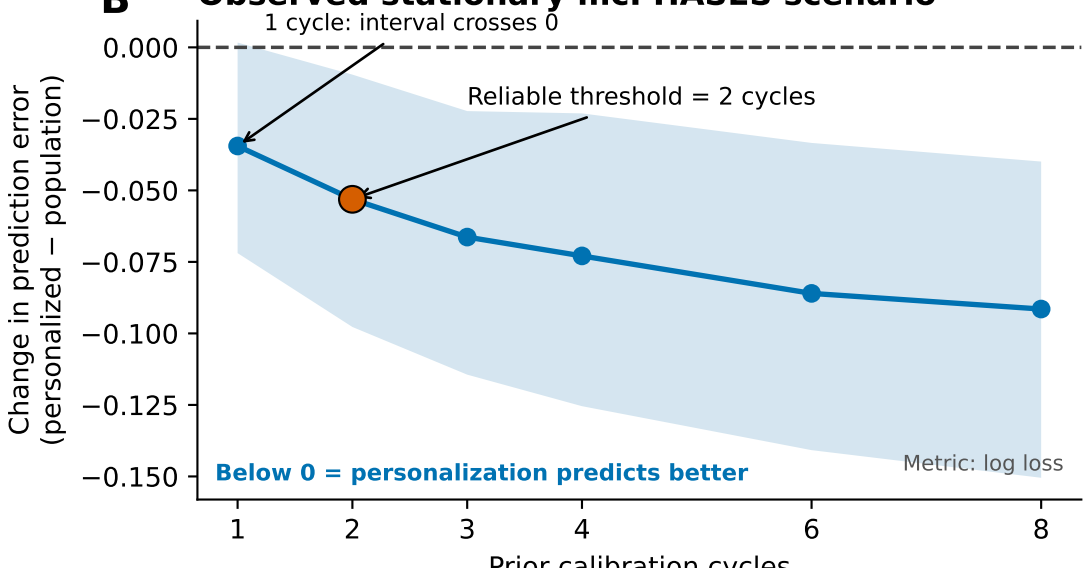

↓

More calibration cycles estimate the stable personal signature

More history helps when repeatable personal signal is large relative to cycle variability.

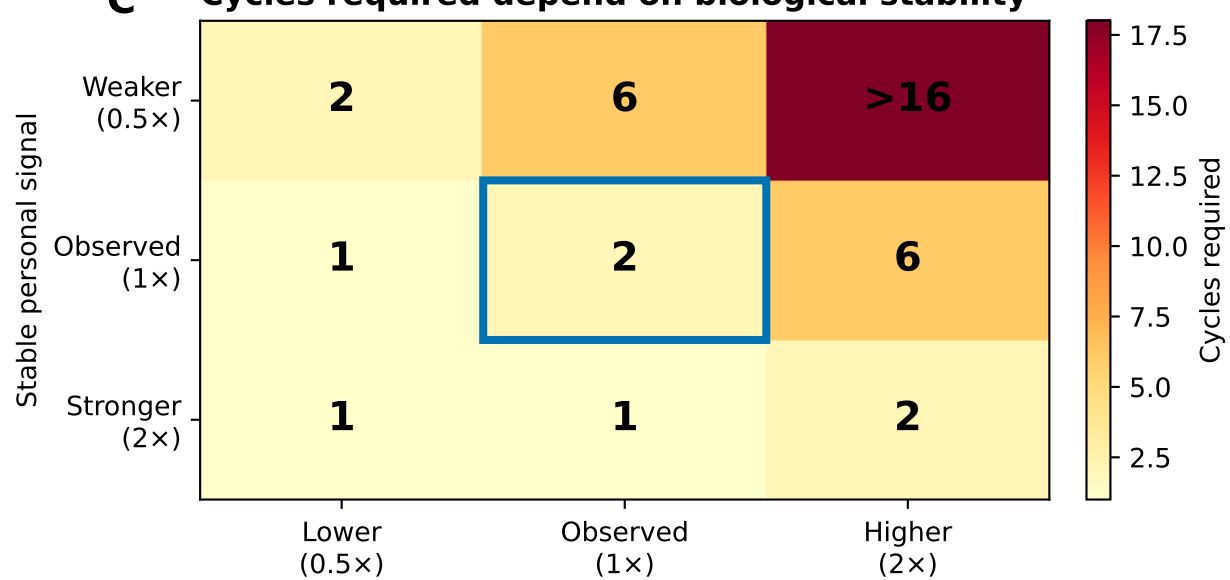

B

Observed stationary mcPHASES scenario

C

Cycles required depend on biological stability

Blue outline = observed mcPHASES

Cell value = calibration cycles required for reliable improvement
